Outline

- Motivation
- 2 The Model
- Results
- 4 Empirical Analysis
- Conclusions

Motivation

• What are the effects of income inequality in credit?

- What are the effects of income inequality in credit?
- Theoretical arguments:

- What are the effects of income inequality in credit?
- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).

- What are the effects of income inequality in credit?
- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).
 - Within-group income shocks drive to higher demand for credit to maintain consumption (Krueger and Perri, 2006).

- What are the effects of income inequality in credit?
- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).
 - Within-group income shocks drive to higher demand for credit to maintain consumption (Krueger and Perri, 2006).
 - Between-groups rise in income inequality increases the bargaining power of the rich, who recycle part of the additional income to poor by ways of loans (Kumhof, Rancière, and Winant, 2015).

- What are the effects of income inequality in credit?
- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).
 - Within-group income shocks drive to higher demand for credit to maintain consumption (Krueger and Perri, 2006).
 - Between-groups rise in income inequality increases the bargaining power of the rich, who recycle part of the additional income to poor by ways of loans (Kumhof, Rancière, and Winant, 2015).
- Empirical Evidence:

- What are the effects of income inequality in credit?
- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).
 - Within-group income shocks drive to higher demand for credit to maintain consumption (Krueger and Perri, 2006).
 - Between-groups rise in income inequality increases the bargaining power of the rich, who recycle part of the additional income to poor by ways of loans (Kumhof, Rancière, and Winant, 2015).
- Empirical Evidence:
 - There is no evidence that a rise in top income shares leads to credit booms (Bordo and Meissner, 2012).

Motivation

• What are the effects of income inequality in credit?

- Theoretical arguments:
 - Rising inequality and political pressure to solution conspired to ballon the credit market (Rajan and Myers, 2010).
 - Within-group income shocks drive to higher demand for credit to maintain consumption (Krueger and Perri, 2006).
 - Between-groups rise in income inequality increases the bargaining power of the rich, who recycle part of the additional income to poor by ways of loans (Kumhof, Rancière, and Winant, 2015).
- Empirical Evidence:
 - There is no evidence that a rise in top income shares leads to credit booms (Bordo and Meissner, 2012).
 - Positive relationship between income concentration and private sector indebtedness (Perugini, Hölscher, and Collie, 2015).

Overlapping Generations Model

OLG model along the lines of Matsuyama (2004).

- 2 key additional features are included:
 - Income heterogeneity among agents.
 - Bankruptcy and general collateral laws.

Distributional effects on credit measures are shaped by:

- Aggregate Income.
- The quality of legal system.

Short and Long-run effects appear.

OLG: Description

Agents

- Two-period lived: young and old.
- Born with I^z units of observable labour, $I^z \sim \Gamma(I^z), I^z \in [0, I_{max}]$.
- Young work, earn $w_t I^z$ and save.
- Old can ask for a loan to invest in a risky project.

Goods

- Capital and output (consumption good).
- Output can be invested at a gross international rate $(1 + \rho^*)$.

Production technologies

- Old can produce physical capital investing one unit of output.
- Firms produce output contracting K and L.

OLG: The analysis

Firms

- Homogeneous per-capita production function $f(k_t)$ with $k_t = \theta \kappa c p_t$.
- Set competitive prices: $p_t = f'(k_t)$ and $w_t = f(k_t) k_t f'(k_t)$.

Agents

- Young save $w_t I^z$ for next period.
- Old who access to credit solve $(I^z \geq \hat{I}_t(\phi, \nu))$:

$$\max_{D_{t+1}^z} \left\{ egin{aligned} \Pi_{et+1}^z &\equiv heta \kappa
ho_{t+1} - (1 + r_{t+1}^z) D_{t+1}
ight\} \ s.t. & \Pi_{et+1}^z \geq 0 \ (PC) \ \Pi_{et+1}^z &\geq A(\phi, D_{t+1}^z) \ (IC) \end{aligned}$$

Assumptions: $A_{\phi} < 0, A_D > 0, A_{DD} < 0$ and $w(\theta \kappa) I_{max} < 1$.

OLG: The Equilibrium

• Banks profits for setting a contract with z are:

$$\Pi_{bt+1}^{z} = [\theta(1+r_{t+1}^{z}) - (1+\rho^{*})](1-w_{t}I^{z}) + (1-\theta)v$$

They are competitive and set:

$$(1+r_{t+1}^z) = \frac{1+\rho^*}{\theta} - \frac{(1-\theta)v}{\theta(1-w_t)^z}$$

ullet The minimum labour $\hat{l}_t(\phi, v)$ required for credit at t+1 is:

$$\theta \kappa p_{t+1} + (1-\theta)v - (1+\rho^*)(1-w_t\hat{l}_t) - A(\phi, 1-w_t\hat{l}_t) = 0$$

• The PC condition reads: $\theta \kappa p_{t+1} + (1-v)\theta \ge (1+\rho^*)$.

Assumption:
$$\theta f'(\theta \kappa) \ge (1 + \rho^*)[1 - w(\theta \kappa)\hat{l}(\theta \kappa)] - (1 - \theta)v$$
.

OLG: Dynamics

Capital formation curve

$$k_{t+1} = \begin{cases} \Upsilon(k_t) & \text{if } k_t < \hat{k}(\phi, v) \\ f'^{-1}\left(\frac{(1+\rho^*)-(1-\theta)v}{\theta\kappa}\right) & \text{if } k_t \ge \hat{k}(\phi, v) \end{cases}$$

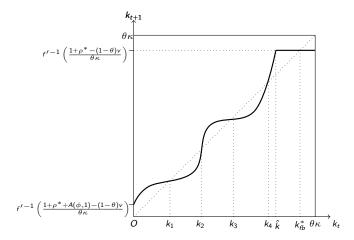

where $k_{t+1} = \Upsilon(k_t)$ arises from $k_{t+1} = \theta \kappa [1 - \Gamma(\hat{I}(k_t, k_{t+1}))]$.

Our interest variables are

- Aggregate debt: $\overline{D}_{t+1} = \int_{\hat{l}_t}^{l_{max}} (1 w_t) \partial \Gamma(l^z)$.
- Credit penetration: $cp_{t+1} = 1 \Gamma(\hat{l}_t)$.

OLG: Dynamics

Figure: Dynamics and multiply steady-states

Main Result: effects of an aggregate redistribution

Result

Consider countries 1 and 2 such that the aggregate income distribution in country 1 at t is a MPS of that of country 2 with mean $\overline{W}_{t-1} + \overline{W}_t$. If $w_{t-1}\hat{l}_{t-1}, >> \overline{W}_{t-1}, w_t\hat{l}_t >> \overline{W}_t$, then credit penetration and total debt are higher in country 1 at t + 1. If the opposite is satisfied the result is reversed.

- Short-run effect:
 - ↑ inequality at t in credit constrained countries
 ↑ cp_{t+1}, \(\overline{D}_{t+1}\), \(\overline{G}DP_{t+1}\).
- Long-run effects:
 - Credit multiplier effect.
 - 'Jump' to the basin of attraction of a higher ss.

Mapping to data and baseline regression

Data

• Panel of 148 countries in the period 1986-2013(World Bank, WDI).

Mapping

- \overline{D} : private credit/GDP.
- \overline{W} : GDP per-capita.
- (ϕ, v) : Strength of Legal Rights Index(0-12).
- $Var(\Gamma)$: Gini and top 10% income share.

Baseline model

```
\begin{aligned} \textit{PrivateCredit}_{i,t} &= \alpha_i + \nu_i + \beta_1 \textit{Inequality}_{i,t-1} + \beta_2 \textit{GDPpc}_{i,t-1} + \beta_3 \textit{LegalRights}_{i,t-1} \\ & \beta_4 \textit{Inequality}_{i,t-1} \times \textit{GDPpc}_{i,t-1} + \beta_5 \textit{Inequality}_{i,t-1} \times \textit{LegalRights}_{i,t-1} + \epsilon_{i,t} \end{aligned}
```

Expected results: $\beta_1 > 0, \beta_4 < 0$ and $\beta_5 < 0$

Baseline regression

Robustness

• Include additional controls: population, schooling, natural resources, net interest margin (Allen et al., 2014).

- Instrumental variables:
 - Inequality: residual variation that is not due to Private Credit (Fatás and Mihov, 2003; Brueckner and Lederman, 2015).
 - GDP per-capita: latitude (Acemoglu, Johnson, and Robinson, 2001)
 - LRI: Legal Origins (La Porta, Lopez-de Silanes, and Shleifer, 2008)
- Sub-samples:
 - Exclude LAC.
 - Exclude Africa.
 - Separate by high and low income countries.
- Alternative LRI measures. (Djankov, McLiesh, and Shleifer, 2007, and Doing Business)

Robustness

Table: Determinants of Private Credit to GDP for the Sample of Non-African and Non-LAC Countries

Conclusions

Novel theoretical and empirical nexus between inequality and credit:

Greater income inequality leads to higher private credit in countries with low income and weak creditor rights.

The opposite in high income/strong legal rights countries.

 New credit channel mechanism which can be an alternative explanation for similar effects of inequality in growth (Galor and Zeira, 1993; Brueckner and Lederman, 2015).
